

ANNUAL SURVIVORSHIP SUMMARY

CANCER SURVIVORSHIP CLINIC

March 14, 2024

SURVIVORSHIP CARE PLAN

Patient: Joshua Perez

DOB: 06/14/1988

Diagnosis: AML, Favorable Risk (NPM1+/FLT3-)

Treatment Period: May-October 2022

Dear Joshua,

Congratulations on approaching your 2-year milestone! This letter summarizes your journey and outlines your ongoing care plan.

YOUR CANCER STORY:

At age 33, you were diagnosed with favorable-risk acute myeloid leukemia after presenting with fatigue and night sweats in May 2022. The leukemia had a mutation called NPM1, which generally responds well to chemotherapy.

TREATMENT RECEIVED:

- Induction: 7+3 chemotherapy (May 16-22, 2022)
- Response: Complete remission achieved
- Consolidation: 4 cycles of high-dose cytarabine (June-October 2022)
- Total hospital days: 47

WHERE YOU ARE NOW:

✓ 22 months with no signs of leukemia ✓ Blood counts completely normal ✓ Molecular testing shows no NPM1 mutation detected ✓ Risk of relapse decreasing each month (now <15%) ✓ Back to full activity including marathon training

FOLLOW-UP SCHEDULE:

Year 2-3 (current):

- Blood work every 3 months
- Bone marrow biopsy at 2 years (due May 2024)
- See oncology team every 6 months

Years 3-5:

- Blood work every 6 months
- See oncology yearly

- Bone marrow only if concerning symptoms

After 5 years:

- Considered cured!
- Annual check-ups with primary care

WHAT TO WATCH FOR:

Contact us immediately if you experience:

- Unusual bruising or bleeding
- Persistent fevers
- Extreme fatigue
- Bone pain
- Recurring infections

LATE EFFECTS TO MONITOR:

From your chemotherapy:

- Heart: Echo every 5 years (last one normal)
- Fertility: Semen analysis showed normal counts (good news!)
- Secondary cancers: Very low risk, annual skin checks recommended
- Cognitive: No issues noted, let us know if concerns

HEALTHY LIVING RECOMMENDATIONS:

1. **Exercise:** Continue your running program - excellent for recovery!
2. **Diet:** Mediterranean diet you've adopted is perfect
3. **Alcohol:** Moderate consumption okay (you don't drink much anyway)
4. **Sun protection:** Always use SPF 30+
5. **Vaccinations:** Flu shot yearly, COVID boosters as recommended
6. **Mental health:** Consider joining young adult survivor group

FERTILITY UPDATE:

As discussed, your recent fertility testing shows normal sperm counts and motility. The chemotherapy did not appear to impact your fertility. Family planning can proceed normally when you and your partner are ready.

RETURNING TO WORK:

You've successfully returned to your software engineering position. Remember that "chemo brain" can persist for 1-2 years - the cognitive exercises app you're using should help.

KEY CONTACTS:

- Routine questions: Survivorship nurse (555-SURVIVOR)

- Urgent concerns: Oncology triage (555-ONCO)
- Mental health support: Social work (555-SUPPORT)
- Fertility counselor: 555-FAMILY

BOTTOM LINE:

Joshua, you're doing exceptionally well! Your type of leukemia (NPM1+ without FLT3) has one of the best cure rates with chemotherapy alone - approximately 60-70% of patients are cured. You're well on your way to joining that group.

Keep up the amazing work with your healthy lifestyle. We're here if you need us, but increasingly, you'll need us less and less!

With admiration for your strength,

Sarah Kim, MD
Director, AML Survivorship Program

P.S. - Good luck with the Boston Marathon! Several of our survivors will be running too.
