

CLINICAL TRIAL SCREENING NOTE

PHASE II TRIAL SCREENING VISIT

Protocol: REVOLUTN-AML-2024

Date: February 28, 2024

SUBJECT: Larry Turner (MRN AML039)

DOB: 03/05/1958

Original Diagnosis: 11/29/2021

Prior Treatment: 7+3 induction + 3 cycles HiDAC

Mr. Turner is a 65-year-old gentleman with relapsed AML (wild-type, intermediate risk) being screened for our phase II trial of novel menin inhibitor REVT-2024.

DISEASE HISTORY:

Diagnosed 11/29/21, achieved CR1 with 7+3 (started 12/06/21). Completed consolidation through April 2022. Remained in CR for 19 months before relapsing in July 2023 with 31% marrow blasts.

SALVAGE TREATMENT:

- Venetoclax/azacitidine x4 cycles: Achieved CR2 (September 2023)
- Currently 5 months in CR2 but with rising MRD (0.08% → 0.31% → 0.89%)
- Not transplant candidate (no matched donor, patient preference)

ELIGIBILITY ASSESSMENT:

✓ Confirmed AML in CR2 with rising MRD

✓ Age 18-75

✓ ECOG PS 1

✓ Adequate organ function:

- Cr 1.0, ALT 28, Bili 0.7
- EF 58%
- No active infection

✗ EXCLUSION: On further review, patient lacks KMT2A rearrangement or NPM1 mutation (required for protocol)

OUTCOME: SCREEN FAILURE - lacks molecular inclusion criteria

ALTERNATIVE PLAN:

- Referred to competing trial (PIONEER-7) for MRD+ AML
- Continue current monitoring
- Discussing potential for donor lymphocyte infusion from haploidentical donor
