CLINICAL SUMMARY FOR DEATH CERTIFICATE

Decedent: Richard Hall (MRN AML041)

DOB: 02/18/1956

Date of Death: December 22, 2022

Time: 03:42

Location: ICU, Room 4B

IMMEDIATE CAUSE OF DEATH: a. Intracranial hemorrhage (interval: 2 days) b. Refractory thrombocytopenia (interval: 6 months) c. TP53-mutated acute myeloid leukemia (interval: 8 months)

CLINICAL COURSE:

66-year-old male diagnosed with adverse-risk AML (TP53-mutated, complex karyotype) on 04/11/22. Treated with venetoclax/azacitidine starting 04/18/22.

Initial response: Partial remission with persistent thrombocytopenia (platelets never >30K despite transfusions).

Disease progressed late October 2022. Given TP53 mutation and poor PS, no further anti-leukemic therapy pursued. Enrolled in hospice 11/15/22.

TERMINAL ADMISSION: Brought to ED 12/20/22 by family after acute confusion, left hemiparesis. CT showed large right intracerebral hemorrhage with midline shift. Platelets 4K despite daily transfusions. Neurosurgery consulted - not surgical candidate given coagulopathy and poor prognosis.

Comfort care initiated 12/21/22. Expired 12/22/22 at 03:42 with wife and children at bedside.

MANNER OF DEATH: Natural

TOBACCO USE CONTRIBUTED: No

AUTOPSY: Declined by family

Completed by: Janet Morrison, MD
