

**RIVERSIDE MEDICAL CENTER
PALLIATIVE CARE CONSULTATION NOTE**

Date: 15.07.2022
Patient: Arthur Bell
DOB: 04.11.1948
MRN: AML061

NOTIFICATION OF DEATH

Mr. Arthur Bell, 73-year-old male with adverse-risk acute myeloid leukemia, expired on July 15th, 2022, at 2:15 AM in our inpatient hospice unit.

Mr. Bell was diagnosed with AML in June 2021 following evaluation for progressive weakness and recurrent infections. Bone marrow biopsy revealed 82% blasts with cytogenetics showing t(6;9)(p23;q34.1), a rare translocation associated with poor prognosis.

He received intensive induction chemotherapy with 7+3 (daunorubicin 60mg/m² days 1-3, cytarabine 100mg/m² continuous infusion days 1-7) starting June 19th, 2021. Course complicated by prolonged neutropenia, mucositis, and Pseudomonas pneumonia requiring ICU admission and mechanical ventilation for 8 days.

Achieved morphologic complete remission after induction. Proceeded with consolidation therapy using high-dose cytarabine (HiDAC) 3g/m² q12h days 1,3,5 for two cycles. Tolerated reasonably well with manageable cerebellar toxicity.

Unfortunately, routine surveillance bone marrow in mid April 2022 revealed relapsed disease with 65% blasts and identical cytogenetics. Given his age, performance status decline (ECOG 3), and adverse cytogenetics, he was not considered candidate for salvage chemotherapy or transplantation.

Palliative care initiated May 2022. Focused on symptom management, transfusion support, and quality of life. Final weeks complicated by progressive leukostasis, intracranial hemorrhage, and multi-organ dysfunction. Family present at bedside during final moments.

COMORBIDITIES AT TIME OF DEATH:

- Coronary artery disease s/p CABG 2018
- Chronic obstructive pulmonary disease
- Type 2 diabetes mellitus
- Stage 4 chronic kidney disease
- Peripheral arterial disease

Mr. Bell was survived by his wife of 45 years, Margaret, and two adult children. He was a retired construction foreman known for his work ethic and devotion to family.
