Subject: Joyce Murphy - AML Update

Dear Dr. Williams,

Quick update on our shared patient Joyce Murphy (DOB 17.08.1955) regarding her AML management.

As you know, Joyce was dx'd w/ favorable-risk AML in on Feb 22, 2023 (NPM1 mut, no FLT3-ITD, normal cyto). At 67 y/o with multiple comorbidities (COPD, CHF EF 35%, CKD stage 3b), we opted for azacytidine monotherapy since Feb 28, 2023 given indolent course and patient preference to avoid chemo.

Latest labs show stable disease:

- WBC 3.2 (20% blasts in peripheral blood, down from 35% at dx)
- Hgb 10.8 (transfusion-independent)
- Plt 95k (stable)
- NPM1 mutation tracking stable at VAF 28%

She remains asymptomatic - walking 2 miles daily, managing her garden, no B-symptoms. ECOG 0-1. We're continuing active surveillance with monthly labs, q3month BM aspirates.

Interesting case of indolent AML behavior in elderly patient with favorable genetics. Literature suggests some NPM1+ cases can have protracted course, especially in older patients. Will continue monitoring closely but no treatment indication currently.

She's scheduled for routine f/u next month. Please continue her cardiac and pulmonary management as usual. Let me know if you have any concerns.

Best,
Rebecca Chen, MD
